

THE SIX AND TEN REPORT

June 2003

- Section 1. Analysis of 28 MHz reports from the UK**
- Section 2. Analysis of 50 MHz reports from the UK**
- Section 3. Solar and Geomagnetic Data**
- Section 4. 50 MHz outside Britain**
- Section 5. Beacon news and 28 MHz worldwide**

Editors. Martin Harrison G3USF and Steve Reed G0AEV

Analysis of 28 MHz reports from the UK

28 MHz reports and logs for June 2003 from G2AHU, G3IMW, G3USF, G4TMV, G4UPS, G0AEV, G0IHF and from packet cluster reports. Compilation and commentary by G0AEV.

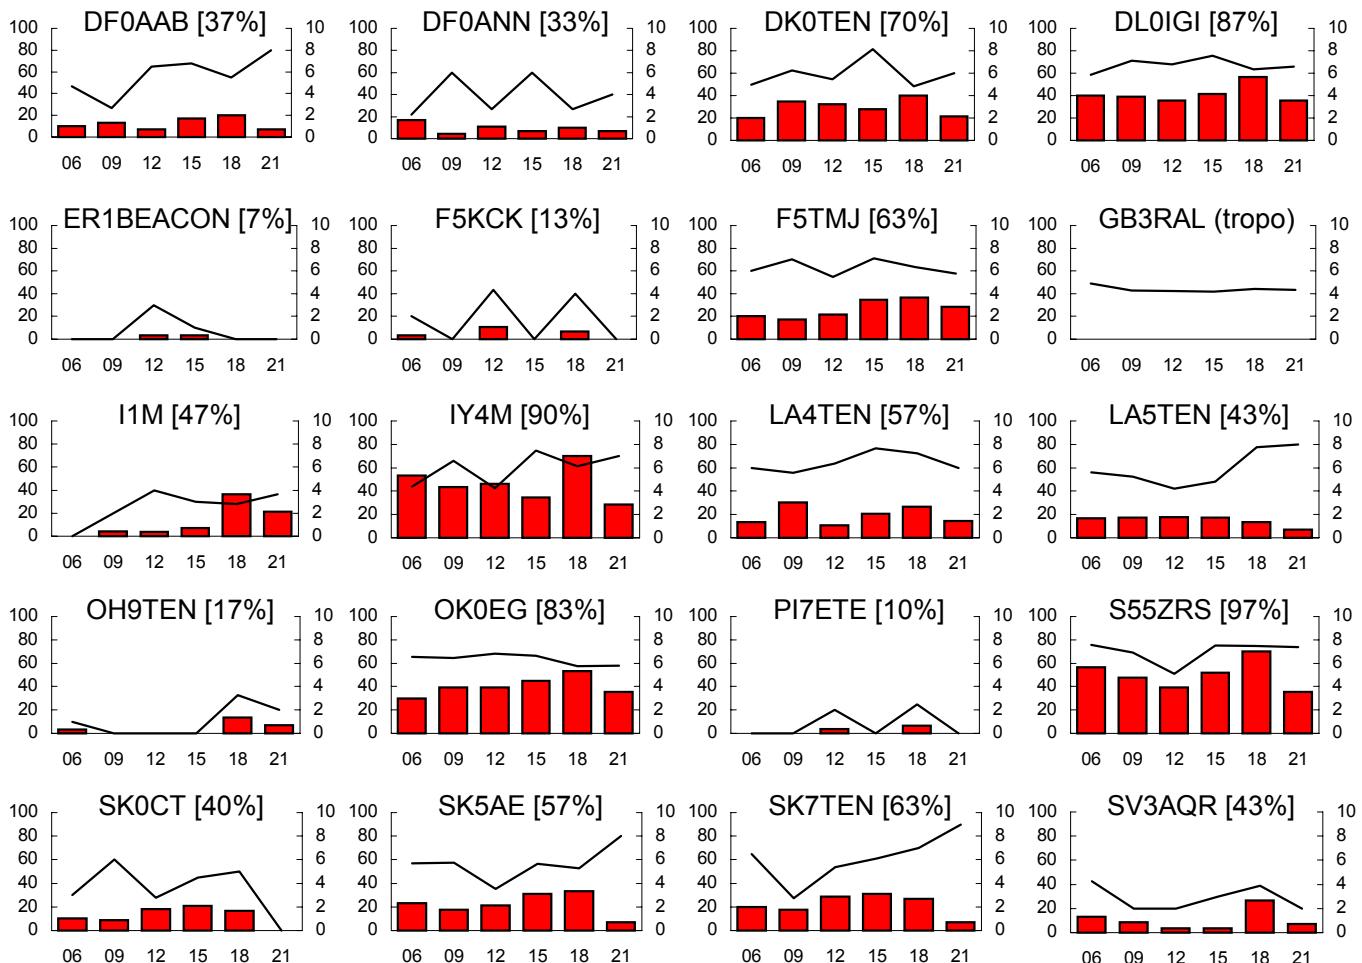

Solar flux increased slightly in June (compared to May) but this had no discernible effect on 10m. Season variations were, as always, the predominant control on the observed continued decline in the availability of DX and the reliability of DX propagation. Magnetic disturbances, characteristic of the current stage in the solar cycle, continued to feature strongly and had an additional dampening effect. The result was relatively poor propagation *via* F2 largely restricted to Africa and to southern South America.

Conversely, but also for seasonal reasons, sporadic E was very good, including openings on every day of the month. Reports received that indicated Trans-Atlantic multi-hop to North America were disappointingly small considering the significant number of such events identified at 6m, but this was partly because many of the openings were to the Caribbean, a region lacking in 10m beacons.

Beacon graphs legend

Legend for all beacon graphs: - graph bars (left Y-axis): beacon reliability as the percentage of days a beacon was heard by any UK observer within each time band. Graph lines (right Y-axis): signal strength as the average of the daily maximum signal reported by any observer in each time band. Time band codes (X-axis): 6=0600-0900, 9=0900-1200, 12=1200-1500, etc. Callsigns are followed by daily reliability figures, the percentage of days per month when the beacon was reported.

European Propagation / Beacons

Propagation modes for European beacons. All reported beacons were heard by E-layer propagation (except GB3RAL – heard by G0AEV via tropospheric modes), this being very predominantly normal direct path sporadic E but including some Es backscatter and, in the late evenings, a little auroral E, as detected by the Scandinavian beacons. There was no inter-European F-layer propagation (a consequence of low mid-summer F2 critical frequencies).

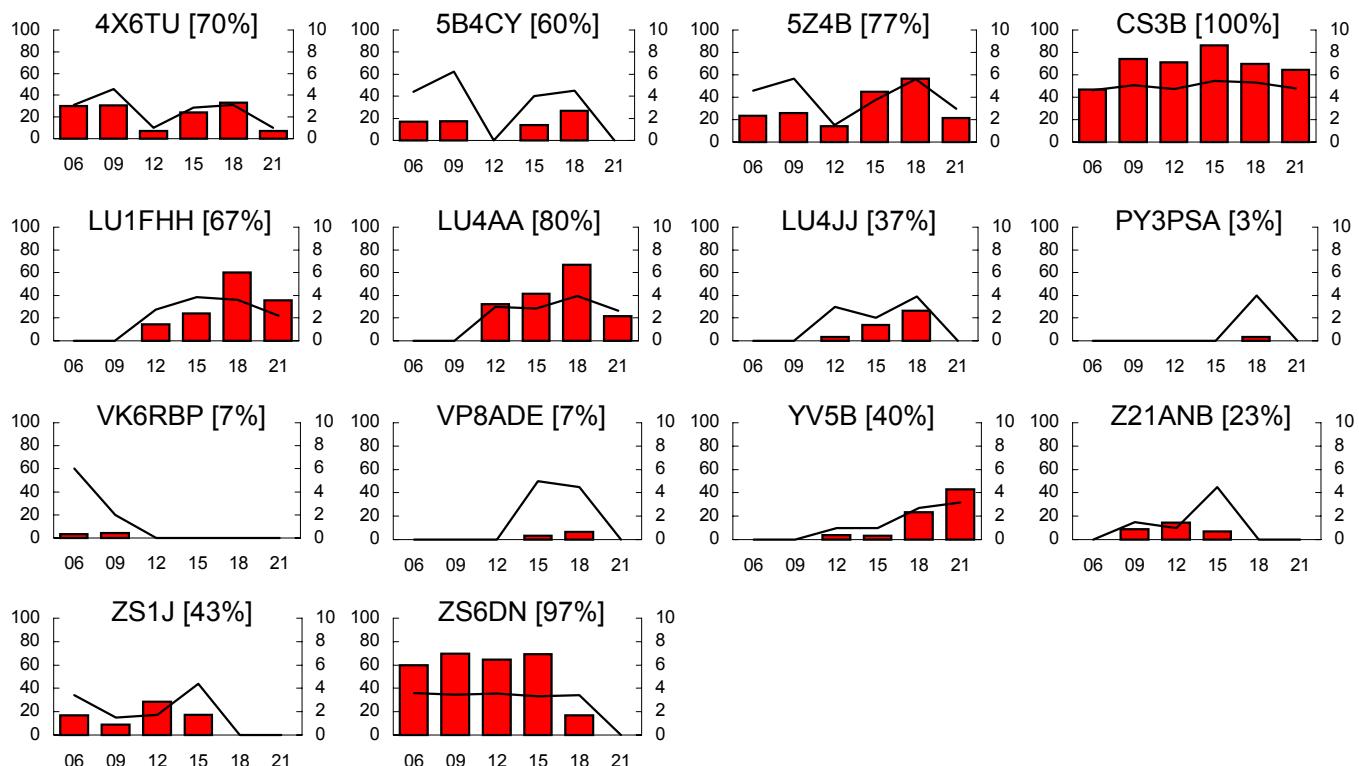

Beacon Notes. Four German beacons were reported in June but also transmitting (and logged in the UK) in July were DL5KZ (28.321) and DF0THD (28.325) – these are outside the normal beacon band limits so may not be heard unless one “listens up”. DL5KZ appears to be regular, DF0THD appears may be intermittent. Beacon observers please note that DF0AAB (28.287) and DF0ANN (28.265) have similar calls but are different beacons!

Also on the high side of the beacon band was ER1BEACON in KN46 transmitting on approximately 28.326 from May, but first reported in the UK in June. This beacon went QRT around the end of June but was replaced shortly afterwards by ER1AAZ on 28.220.

F5KCK (28.110) is very low in the band and is poorly reported as a consequence (and perhaps also because of the gaps in the “robot” transmission - compare with continuous beacon F5TMJ). IY4M is another “robot” beacon (i.e. receives as well as transmits) was heard on 90% of days in June. By comparison I1M, which also has transmission gaps, was poorly reported with only G0AEV hearing the beacon regularly – this explains the peak in reliability in the evening when I listen most often.

GB3RAL went QRT on 4 July. OH2B remains QRT after the theft of the beacon transmitter. PI7ETE was heard on only 3 days because it is too close to much of the UK for sporadic E except under very short skip conditions.

Propagation to Asia, Africa, Oceania, South and Central America

Suggested propagation modes. Most of the beacons reported above were heard by normal F-layer propagation except for 4X6TU, 5B4CY and CS3B, which were heard by a combination of F-layer and sporadic E. In the case of 4X6TU and 5B4CY, double hop sporadic E was probably the dominant mode. CS3B is a little more difficult to evaluate. CS3B was the only beacon to achieve a 100% daily reliability this month and on some days it was audible, apparently continuously, from sunrise through to late evening. This is not the pattern expected from sporadic E! The review of propagation trends in the

period 1999-2002 as shown by the IARU beacons (*Six and Ten Report*, February 2003) suggested that during mid-summer both F and E layer modes are operative on the G-CT3 circuit. By extrapolating the trends exhibited by F2 propagation in the rest of the year it is possible to estimate that reliability of CS3B in June could be attributed 60% to F2 and 40% to Es.

Reliability on the F2 paths to southern African and to southern South America continued to do reasonable well considering the season, and the lower solar activity and higher geomagnetic activity present at this stage of the solar cycle. ZS6DN was reported on every day in June bar one, and the chance of hearing that beacon in any one of the 3 hourly time bands between 06 and 18z was around 60%. Longer paths to ZS1 and to VP8 were rather more reduced in reliability.

In recent months VK6RBP has not been reported or reported less often than might be expected. In June, VK6RBP was reported on two days, which is about the right sort of level of reliability expected at this time of year and position in the solar cycle.

Beacon Notes. OA4B is still QRT. The absence of signals from 4S7B in recent months suggested a continued problem with this beacon, but in mid-summer the lack of propagation prevents any sensible analysis of the situation form the UK. The report of PY3PSA may have been in error – if active, beacons in Brazil should be heard at similar or slightly lower levels of reliability to the LU beacons.

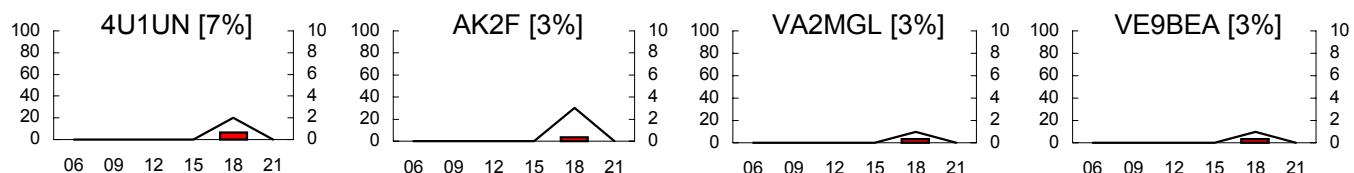

10m DX in June 2003

The following very reduced list of DX (non-European) countries recorded as worked/heard in the UK list comes from DX packet cluster spots and from contributor logs. Although partly a reflection of lack off amateur activity rather than lack of propagation, the list does indicated the relative difficulty in working outside of Europe during the middle of the summer. Of the countries listed several (4X, 7X, 5B, OD, W) were worked by sporadic E.

4X, 5B, 7X, A4, A7, CE, EA8, LU, OD, PY, W, YV, ZP, ZS

Propagation to North America

The seasonal decline in propagation by F2 to North America reached its nadir in June – there was no propagation by this mode at all. This is normal, even in years of high solar activity. However, there were openings to North America on 10m but these were by multi-hop sporadic E. Six metre operators identified Es openings to USA, Canada or the Caribbean on around half of June days, a remarkable statistic. It has to be admitted that many of the openings were very restricted and almost certainly only detected by dedicated listening. 10m beacon monitoring performed poorly in comparison, with only one event (26th) being reported. In past years when I was able to test for trans-Atlantic events in a rigorous way I could hear 10m beacons on nearly all occasions when openings were reported on 6m, and I sometimes heard 10m beacons when no propagation was reported at 50 MHz. It seems likely, therefore, that the results charted below represent a minimum view of Trans-Atlantic Es in June 2003.

In addition to the above, GM8LFB spotted hearing N9RET at 2237 on 26th.

Analysis of 50 MHz reports from the UK

UK 50 MHz reports for June 2003 from G2ADR, G2AHU, G3HBR, G3IMW, G3USF, G4UPS, G0AEV and via packet cluster spots. Compilation and commentary by G0AEV.

Tabulations 50 MHz compilations are presented in tables ordered alphabetically by country prefix. Percentages following the country name are the daily reliability values (the percentage of days when propagation was reported). The first row of each table labelled "D" is the day of the month, subsequent rows give the maximum signal strength reported from the UK in each of three hour time bands ("06" for the band 0600 - 0900 UTC, "09" for the band 0900 - 1200 UTC, etc.) A figure of "0" indicates that signal strength was not reported.

Sporadic E

I wonder what readers think of the 2003 sporadic season so far? I am quite impressed. There has been a lot of activity: some sporadic E on every day in June, especially good multi-hop to both east and west (including an almost unprecedented number of trans-Atlantic openings), some short skip, and one or two excellent Es backscatter events. If the amount of data requiring compilation is any kind of indicator (3.5 pages of tabulations follow), then it has been a record month!

Brian G3HBR thought six had been a "mixed bag" with some good stuff about but openings appearing to be increasingly selective. Brian makes a valid point that there are some very well equipped stations about these days. With high stacked antennas these stations are able to hear (and work) weak signals under marginal conditions not available to the rest of us. This has, no doubt, contributed to the high numbers of country areas reported.

Particularly good periods for sporadic E were 5th to 10th and 16th to 30th. June 26th was undoubtedly the best day of the month (see below) and June 1st the poorest.

Sporadic E Backscatter

The following lists contacts and SWL reports where the propagation mode was indicated as backscatter (presumably from the E-layer in all cases). Comments in brackets and italics are mine.

Es Summary

The table below displays summary counts of country/areas heard/worked in the UK derived from the detailed data in the preceding sections. Text that is highlighted in bold indicates when 10 or more country-areas were reported. Cells with background shading are for times when the K-index for Hartland (Devon) was 5 or greater. Daily totals are recorded in the solar data table presented later in this Report where these number can be compared with solar, ionospheric and geomagnetic indices.

Es Summary (all data)

	1	2	3	4	5	6	7	8	9	10	11	12	13	14	15	16	17	18	19	20	21	22	23	24	25	26	27	28	29	30	
00																			3												
03

15	4		4	10	11	9	9	14		3	3	3	4	3	12	17	6	11	4	13	7	5	5	3	19	10	5	17	5		
18	2	1	9	10	13	17	1	7	8	3	8	6	8	9	6	16	3	4	3	9	4	3	20	6	30	8	11	21	15		
21	2	1	7	4	8	4	1	6	2	2	9	3	2			3		1	4	4		4	7	10	3	1	5	5	5		

In most instances the table above shows that elevated geomagnetic activity had a negative effect on sporadic E - area counts are low (or lower than on adjacent days) where the Hartland K index was 5 or more. In two cases the reverse was apparent. On 17th, one of the best days for inter-European sporadic E, high geomagnetic activity coincided with high country/area counts. Countries from all over Europe were involved in the events of the 17th, but propagation to Scandinavia was pretty good and this might indicate that the sporadic E had received a contribution from an auroral E source. The second positive correlation between Es and magnetic activity was on 27th June.

Some propagation across the Atlantic was reported on two thirds of days during the month. This includes a large number of very localised openings detected by only one or two people and several widespread events. 50 MHz openings to/from the UK covered the length of the North and Central American east-coastal regions from Greenland through to Venezuela (southern South America normally requires the involvement of the F-layer). There were no instances (reported to me) of signals taking that extra hop in to the continental interior.

Es Summary for Trans-Atlantic openings only

(Data for: 8P, 9Y, C6, FG, FJ, FM, FP, FY, HI, J6, KP4, KP2, OX, TG, TI, V2, VE, VE8, VP9, W and YV)

The first opening of any note was to the Caribbean on 5 June. Ted G4UPS reports that at his QTH the opening starting at 1629z with HI8ROX and at 1639 WP4LNY both SSB. A more widespread opening to Caribbean occurred on 12th – 8 different Caribbean countries were worked. The 15th was also good, especial to Puerto Rico. The best opening to Canada and the States doesn't stand out well in the tabulation counts because the number of countries available is small compared with the areas involved - this event was on the 26th June

Es Propagation on 26th June

Sporadic E propagation on June 26th was exceptional for several reasons. Openings were widespread with both 6 and 10m experiencing highest recorded area/country counts (37 on 6m, 21 on 10m). Areas heard/worked included double hop to both east and west, with propagation to North America being the best of the season so far. Perhaps the most interesting phenomenon was the reception of band II FM signals from N America in GM and GI. The picture below (published in the Finnish magazine Radioamatööri.- thanks OH2LX) shows the paths involved. Details of this very rare event can be found at <http://www.dxradio.co.uk/transatlanticfm.html>

I am slightly surprised at how "rare" this sort of opening appears to be considering the number of double hop Es openings to USA/Canada at 28 and 50 MHz in relation to the number of ordinary single hop openings. If reasonable 50Mhz transatlantic openings occur around a dozen or so times a year but 90 MHz only once every so many years (whatever that number is), what then are the chances of the Brendan trophies (for a 2m transatlantic QSO) being claimed by sporadic E? I suppose the Band II DX enthusiasts might not detect all openings of this kind - perhaps more marginal openings might go unnoticed.

Below are compilations of the data presented in this Report of 28 and 50 MHz activity on 26 June.

The table above lists the ten metre beacons heard in the UK during each hour of 28th June for which data is available. The column "Nr of reports" is the sum of reports for each beacon for the entire day.

The 50 MHz data in the table on the left is a list of country/areas heard/worked in the UK on 6m on June 26th for each of 6 3-hour time bands. Numbers in the columns are the maximum reported signal strength (a zero indicates no data not zero signal!)

The information from both bands indicates a moderate to good morning phase of activity, with intense activity between 18 and 21z including multi-hop to North America, single hops "en route" for N America (OY, CU), as well as short skip between the UK and ON and PA, and between G and GM.

G3HBR wrote of the transatlantic opening "the W's and VE's were able to work well into Europe and it was no time for common old G's to be calling them and adding to the horrendous QRM. It seemed to me that the opening was quite scattered in North America as I was hearing a few very loud stations widely geographically spaced. He opening lasted quite a long time." Brian also noted the very strong Es from large areas of Europe during the transatlantic opening. It does seem that the best DX available would have been from the East coast of N America through to eastern Europe, or perhaps the Middle East

DX (F2 and TEP) Propagation

The following tabulation shows "DX" openings (i.e. those interpreted to have involved one or more F-layer hops) reported by UK operators in June. The tabulation style follows that used for the Es data.

	7Q (7%)	LU (3%)	PY Brazil (13%)	TR (7%)	ZD8 (7%)	
D	14 23	30	5 14 29 30	4 7	4 21

09						
12						
15	9			1		
18	2	4	5 8 9 9	9	2 7	
21						

The tables below displays summary counts of country/areas heard/worked in the UK derived from the detailed data in the preceding sections. Daily totals are recorded in the solar data table presented later in this Report where these number can be compared with solar, ionospheric and geomagnetic indices.

DX (F2 and TEP +/- Es) Summary

	1	2	3	4	5	6	7	8	9	10	11	12	13	14	15	16	17	18	19	20	21	22	23	24	25	26	27	28	29	30

21																														

Considering how much sporadic E was about it is not surprising that the few "DX" events reported all occurred at approximately the same time as sporadic E events. It is very unlikely considering the season and solar activity levels that DX could be worked in the UK without the assistance of sporadic E, either alone or as the first hop leading to areas south of the UK with F2 propagation.

Meteor Scatter

The following MS instances were reported (mostly from the DX cluster). I have excluded most JT6M contacts from this list because this mode is not used exclusively for meteor scatter - to some users it has become a mode like any other and contacts are made regardless of propagation - hence JT6M contacts made during sporadic openings. Seems a little ridiculous to me!

- 6 1358 GD0TEP > YU1EXY "ms type bursts"
- 7 1223 SP3RNZ > G8PL "ms only" (UKSMG contest)
- 7 2231 LX2SM > G0VSM/P "rather weak burst in jn39bm"
- 8 0725 OK2KJT > G4PCI "nice bursts"
- 8 1144 SP3RNZ > G8PL "ms enhanced, contest"
- 12 1124 MU0FAL > PA2VST 319 ms
- 15 0931 SM2CEW > GM3WOJ "fb burst"
- 15 1455 SM0TSC > G4PCI "Several long nice bursts"
- 16 2225 DL3DXX > (JO61) > GW3LEW "many pings up 599+"

16 2230 G4FVP > TF/G4ODA "heard briefly: MS? Es over my head"
 22 0422 OK2POI > G5B "31-51 MS or iono"
 28 0555 PA0HIP > GB3MRK "long MS bursts"

The G4UPS – SM7AED morning skeds again provided interesting data on the availability of early morning meteor-scatter (and similar, but not easily categorised) propagation.

Aurora

Geomagnetic disturbances abounded in June - 20 days when either the Kp or one or more of the UK K-indices reached 5 or more. The extent of radio aurora indicated below do not seem to match in proportion. However, UK observatories should be a better guide to UK conditions and this month UK observatories identified notably fewer geomagnetic significant disturbances (14) than the planetary index (19)

		2341-2349	OH7KM (KP11) > GB3LER 599 in kp11, G4FVP (IO94) > OH9SIX 569

Tropospheric Propagation

A lot of “tropo” spots posted to the DX cluster this month, but most of these relate to contests (UK Six Metre Group on 7th/8th and the IARU /RSGB trophy contest on 21st/22nd). The majority of the contacts spotted are not particularly spectacular and seem to indicate a normal condition of the band that is only significantly exploited (and reported) during contests. I have discarded obviously short distance contacts but there’s still plenty of medium range stuff (even some from G0AEV!)

- 3 2235 GM8LFB (IO88) > GB3LER 559
- 4 1857 F5NLY (JN08) > GW6TYO

Solar and Geomagnetic Data for June 2003

Data supplied by G0CAS (Sun Mag) and from Internet sources. Compilation by G0AEV.

Sunspot numbers (SEC)	Mean 118.4	Max 207 (10 th)	Min 54 (3 rd)
Solar Flux (28 MHz)	Mean 129.4	Max 193 (11 th)	Min 106 (4 th)

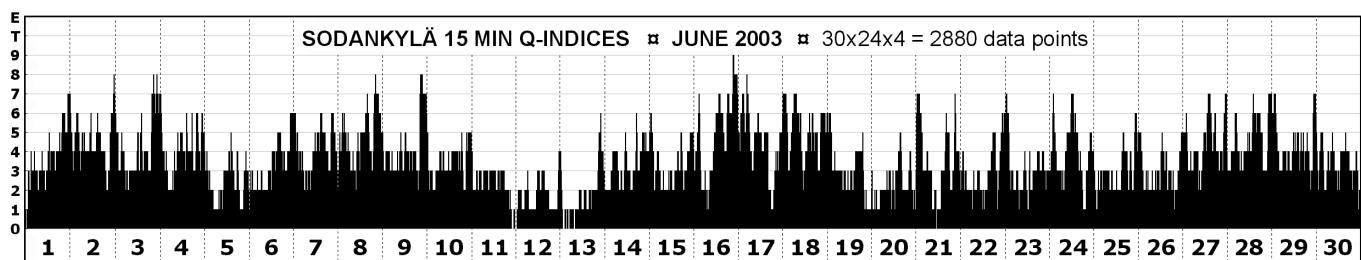

Solar data for June 2003 are presented in the table at the end of this section. Numbers in the 28 and 50 MHz columns are the total daily “areas” worked/heard from the UK, a summary of the data presented in the first sections of this Report. On 28 MHz “areas” refer to the number of beacons reported via Es and F-layer, on 50 MHz the number of countries via Es, F-layer and Aurora. F2 critical frequencies are from Chilton in Oxfordshire, SIDC spots from SIDC, and other solar data from the joint USAF/NOAA daily summaries or directly from SEC.

Solar flux and sunspot numbers are up from the monthly means seen last month (flux 116.2 to 129.4, SEC SSN 89.6 to 118.4) – but, of course, the overall trends are still downward!

Energetic Events (Flares of M and X class).

Q-indices from Sodankylä, Finland (tnx Väinö, OH2LX)

The view of aurora from Finland suggests that June was another very disturbed month

Sodankylä: monthly Ak average = 38.5; most disturbed - 16 June with Ak = 70.
Nurmijarvi: monthly Ak average = 17.6; most disturbed - 18 June with Ak = 44.

K-indices. K indices for June 2003 for Hartland (British Geological Survey) are presented below

50 MHz Outside Britain

Compilation and Commentary by G3USF

Europe

Auroral-Related Propagation

As G0AEV has already noted, by our customary yardstick, twenty days were in some measure 'disturbed'. Propagation that appeared to be auroral-related was reported in continental Europe on twenty days. However, substantial geomagnetic disturbance was mostly confined to the higher geomagnetic latitudes. Putting it another way, geomagnetic activity was frequently substantial enough to affect 28MHz (and sometimes lower bands), while not being so high as to bring aurora down to mid-latitudes. The worst of both worlds! G0AEV's earlier comments appear valid for Europe as a whole. A cautionary word: most experienced operators can assess whether a signal is 'auroral' and report accordingly. However, during the summer, T9 signals from far-north beacons may be normal Es or auroral E, so misidentification can only too easily creep in.

Other Modes

June, as usual, produced substantial volumes of mainly sporadic-E every day from breakfast (or before) until bedtime. (There was also considerable evidence of Es scatter.) Even the most disturbed days at the middle of the month reported a good crop of contacts. As always, many openings were brief and localised, particularly the more intense ones or those involving multi-hop - though the tabulations below also show many events that lasted for a substantial time across a wide swathe. Incidentally, it appears to have been quite a good month for very high Es MUFs. In addition to the trans-Atlantic opening discussed above, DL8EBW lists openings at 144MHz on the 2nd (1730-2030), 4th (1900-2040), 6th (0930-1030) 16th (1523-1636), 17th (1615-1800) 20th (0948-1151 1418-1617) 22nd 0830-1300 to 171MHz). Openings above 50MHz but below 144 included the 5th (1750-1830 90.5MHz) 18th (0500-0530 67MHz), 19th (0800-1130 93MHz) 20th (0900-1030 90MHz) 24th (1600-1730 93MHz) 25th (1800-1900 92MHz), 28th (1230-1400 95MHz) and 29th (16-1700 93MHz).

For the next few years, midsummer rather than autumn will be the peak period for east-west DX working, whether by multihop Es or Es linking with tep or what little F2 may occur. Eastwards from western and central Europe, the month brought almost daily openings to UR, 4X, JY and OD, many of which required 2xEs. Beyond there, the possibilities are limited by restrictions on 50MHz operations, low activity levels and, of course, ocean. Nevertheless, the record includes **YA4F**, into G, DL, ON on the 16th, and DL,F,I0,ON, PA and SV on the 30th, **UN6P** into DL,OE,SM,SP,S5 and 9A on the 9th, and again on the 28th into I and S5, **9M2TO** into Italy on the 2nd, **VR2XMT** with 5B on the 3rd and IT9 on the 19th. **HZ1MD** was worked from the Mediterranean on the 1st, SP on the 3rd, 9H on the 25th and I and SV on the 26th. There were openings to **A61AJ** on the 9th from DL, ES, G,OK,ON,OZ,PA, SV1 and SV8, the 13th from CT the 19th from I, S5, T9 and 9A, the 26th from DL and F and the 28th from CT,EA,EA6,I,IT9,SV,YU and 9H. **A45XR** was into DL on the 9th. SV1DH reports **VK8MS** briefly on the 13th and **JA** weakly on the 28th. **YC1HER**, which might just be a mishearing for a YU station, was reported in 5B and IT9 on the 19th but **YB0DPO** into 4X around the same time looks sure enough. Among openings that appear not to have made it to the European mainland were **BG9BA**, **JA5AIE** and **9M2TO** into 5B on the 12th, **BG9BA** again into 5B on the 15th and 29th, along with **UK** and **UO** on the latter date. **VK8MS** was reported in 5B on the 19th. **JA** is also thought to have been worked from 5B on the 23rd, 27th and 28th, with an unidentified **UA0(SC?)** also on the 27th. In all, a reasonably impressive total, outshining 2002.

Africa was a different matter. Seasonal factors and cyclical decline resulted in meagre results. The only reports from the South were of **7Q7SIX** into F and G on the 14th, G on the 23rd and ON on the 29th. West Africa was rather more productive; **TR0A** was heard in G on the 4th and 7th, DL on the 5th and PA on the 10th, while the **5T6M** expedition caught some excellent openings at the end of the month with DL,EA,G,I,IT9,ON,S5 and 9A on the 29th and DL,EA,F,G,I,IT9,LY,OE,OK,ON,PA,SV,9A and 9H on the 30th. While expeditions invariably give rise to increased reporting, these results may hint at what might have been achieved had there been greater activity. **D44TD** was into DL,OE and 9A on the 10th, EA on the 11th, DL and HB on the 25th and SM on the 29th. Apart from CN, EA8 and CT3 the only other Africans were **SU1SK** on the 7th(I) and 13th(EA, SV) and **S01HA** worked from DL,ON and PA on the 16th.

However, the main DX of the month came from the West. What we know about propagation between Europe and W/VE overwhelmingly arises from European operators. Typically, openings attract ten times as many spots from Europe as from the US or Canada, albeit there is a handful of conscientious North American reporters. It is unclear just why this is the case, though it is a continuing pattern on which we have commented previously: this month the only known opening between Japan and VE7/W7, no routine event, was reported only from the Japanese side. A reminder, then, that this Report can only deal with what is reported and that propagation may actually have been a bit better than we find here. And, while on

reminders, callsigns given in full are either 'DX' or beacons. And, as far as possible, US stations have been assigned to their 'true' call area, with (eg) "/1" added in the detailed listings even though this may not have been transmitted.

Countries along the Mediterranean had a relatively good month, with openings notified on 8 days (2002 5, 2001 6, 2000 13), as SV1DH's report bears witness. So did Iberia with 11 days (2002 12, 2001 8, 2000 15). However, notwithstanding the remarkable propagation on the 26th, already discussed by G0AEV and not known to have been paralleled on the continent, countries further north were down a shade at 10 days (2002 17, 2001 8, 2000 12). All openings appeared to be over a direct path and by multihop Es.

June was also a productive month for propagation between Europe and the rest of the Americas. South and Central America - indeed everything south of the Rio Grande - are grouped here because it seems reasonably clear that the primary mechanism was multihop Es. As usual at this period propagation favoured the northern fringe of South America rather than areas below the Equator, with northern Europe working into that region more readily than Iberia or the Mediterranean. However, all areas had a relatively good month into the Caribbean. The Mediterranean was up from 2 days in 2002 to 8, Iberia from 2 to 7 and northern Europe from 3(or possibly 4) days to 10. Openings also reached a wider range of countries than in most recent years. In addition to the compilation in the box below, PJ was worked only from France on the 12th, FM on the 11th, KP4 on the 6th and FG on the 13th. (Being both 'Mediterranean' and 'Northern' French results are not normally included in these tabulations though they are in the detailed record.)

The June pattern of ionization appears to have been somewhat more southerly than in the past year or so. Unusually, three stations were active from VP9, while W6JKV activated C6. Results from the region might have been somewhat better if there had been more beacons. The good news is that VP9DUB/b has subsequently begun transmissions and there are hopes of a Caribbean beacon.

Apart from trans-Atlantic working, the month brought little of note. Since even the more assiduous reporters filed few spots it would seem this reflected propagation patterns rather than activity or under-reporting.

(However, the pathetic number of 'spots' for the ARRL contest suggest either the contest was a flop or substantial under-reporting.) There were many openings from the US to the Caribbean, clearly involving 1Es or multihop, which from time to time reached the northern fringe of South America. There was a single long-haul opening from the midwest to Chile on the 6th.

The only other reports of note were of EM1U in Antarctica being received in Uruguay on the 30th, openings from Alaska on the 10th(VE6, W7,W7) , 25th (W6) and 26(W7), a solitary ZL report from W0 - remarkable for the season and geomagnetic conditions if authentic - on the 18th (Ap54!) And the opening from the Pacific north-west on the 26th which went completely unreported from the US/VE side (thanks JA1VOK!).

Asia/Pacific

While JA1VOK's report is as usual studded with the sort of callsigns Europeans would love to here, June is generally an unremarkable month for long-haul DX, and the openings reported here are for the most part 'regional'. The exceptions are the opening to VE7/W7 on the 26th, noted earlier, and to Australia, which was much the same as last year (6 days, as in 2002 - but 17 in 2001 and 15 in 2000). VK4 was worked on the 1st, 17th and 25; VK6 on the 1st, 5th, 11th, 17th and 25th and VK8 on the 3rd.

6m DX results in JA during June

Beacon News and 28 MHz Worldwide

Compilation and Commentary by G3USF

Beacon News

3840 ZL1BPU 'precision beacon' from North Auckland with 2.5 watts. Understood to be short-term propagation test. Another such beacon to follow on 3600.000 and one from VK2 14160.8 DL5KZ testing beacon with 10mw to dipole at 7m ENE-WSW.

28193 LU2EOR reported on this new frequency

28195 LU4EG new beacon from Bernal (LU4EG)

28225.4 KD5ITC Corpus Christi is now K5ISS

28231.8 D2BB reported again with 10 watts. Operation irregular

28232 N2UHC Frontenac KS EM27PK 2 watts of a1 to Vertical dipole. Web page

www.geocities.com/n2uhc_2/beacon.html (N2UHC)

28253 VK3RMV QRT - transmitter stolen.

28255 KI4PJ Palm Bay FL runs 5 watts to 4-band vertical 8 hours in 24 (K9QU)

28271 VE1/W1BKR back again from Henry Island FN95 with 3 watt to GP. This operation is said to be permanent; earlier ones have proved to be fairly short-lived (N4SO)

28272.5 K5BTV has moved frequency slightly to avoid interference (K5BTV)

28702.5 Reported to have resumed transmissions after some weeks not-operational.

50027 VP9DUB Hamilton FM72 runs 25 watts to horizontal loop (W3CMP)

50052 SK2CP new auroral beacon from Kiruna/Esrangle KP07MH with 100 watts to 5-el QTF NW 24-hour operation. (SM0KAK/PA1SIX)

50075 OH5SIX unofficially reported this frequency.

50077 K4AHO Zellwood FL EL98FR runs 7.5 watts to omni at 30 ft

50086 LU7YS runs 10 watts to GP @ 7m from FF40KR (LU7YS)

28 MHz Worldwide

This month's 28MHz more or less speaks for itself - though a caution against under-reporting, which appears to be increasing as F-layer contacts become less frequent and Dxpedition activity diminishes, discouraging fair-weather operators from using the band. In short, a downward spiral may be setting in. With relatively high levels of geomagnetic activity propagation was at best mediocre by seasonal standards. Nevertheless it was probably somewhat better than the histograms suggest.

That said, 28MHz is known to have been open within Europe at some time every day, essentially by Es, to South America every day and to Africa every day except the 9th. Parts of Asia were open on 24 days, North America on one day in three and Oceania on 14 days, mainly from southern Europe. As G0AEV commented earlier, the trans-Atlantic circuit was poorer on 28 than on 50. North America had propagation to Oceania on 20 days, to South America every day except the 29th and there were openings within North America on all days. Africa was poor, with openings reported on only 7 days. There were no reports of propagation between North America and Asia.

Very few events appeared more than run-of-the-mill. Those that stood out were reception of the VA2MGL beacon by DF2JQ, who reported at 2134 on the 27th that the beacon had been in 'for hours'. This was the day after the Band II opening discussed earlier. And SP2MKD reported F5TMJ/b at 579 at the early hour of 0323UTC on the 20th.

28 MHz Worldwide - June 2003
