

THE SIX AND TEN REPORT

**May
2005**

- Section 1. Analysis of 28 MHz reports from the UK**
- Section 2. Analysis of 50 MHz reports from the UK**
- Section 3. Solar and Geomagnetic Data**
- Section 4. 50 MHz outside Britain**
- Section 5. Beacon news and 28 MHz**

Editors. Martin Harrison G3USF and Steve Reed G0AEV

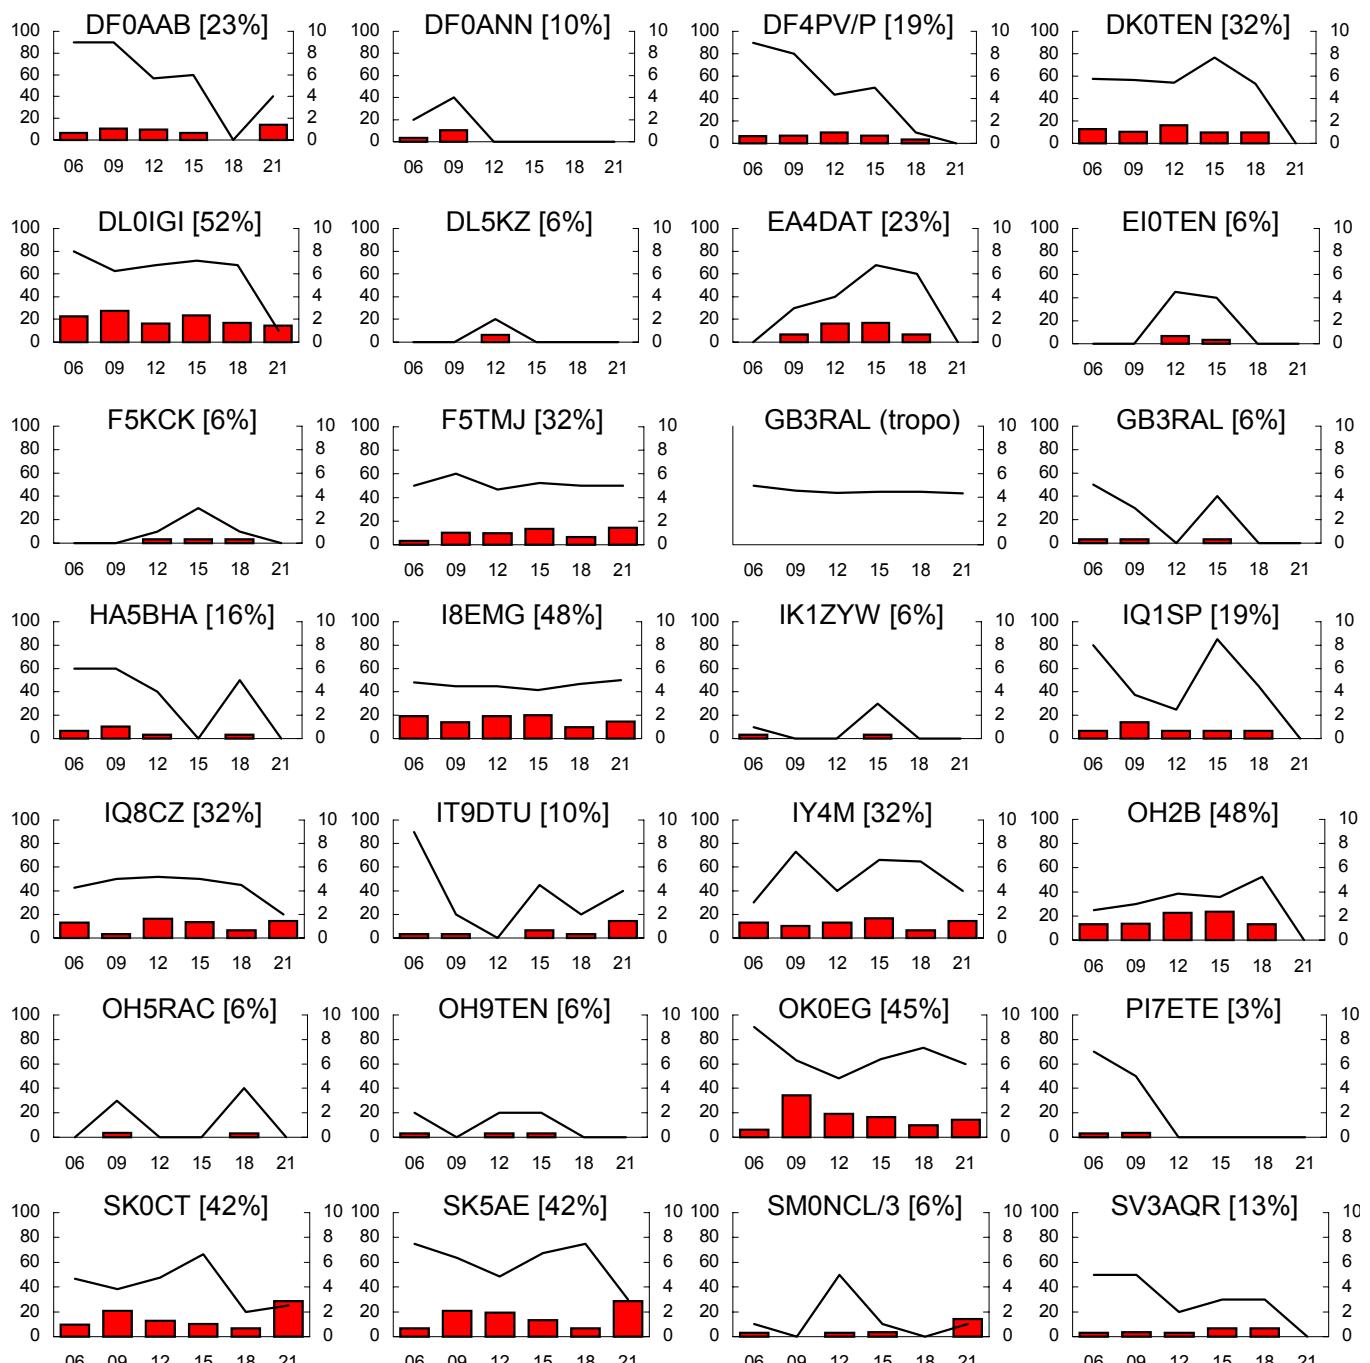

Analysis of 28 MHz reports from the UK

28 MHz reports and logs for May 2005 from 2U0GSY, G2AHU, G3HBR, G3IMW, G3USF, G3YBT, G4JCC, G4TMV, G4UPS, G0AEV, G0IHF and packet cluster reports. Compilation and commentary by G0AEV.

Beacon graphs legend

Legend for all beacon graphs in this Section: - graph bars (left Y-axis): beacon reliability as the percentage of days a beacon was heard by any UK observer within each time band. Graph lines (right Y-axis): Signal Strength as the average of the daily maximum Signal reported by any observer in each time band. Time band codes (X-axis): 6=0600-0900, 9=0900-1200, 12=1200-1500, etc. Callsigns are followed by daily reliability figures, the percentage of days per month when the beacon was reported.

European Propagation / Beacons

Propagation modes for European beacons.

Most of the propagation represented by the graphs on the previous page was single-hop direct-path Sporadic E. There may have been a minor additional component on the graphs for some beacons from Es backscatter – a mode that was presumably responsible for the reception of GB3RAL by several G stations outside of normal tropo range but too close for Es (except extremely short skip). “GB3RAL tropo” are the results of this beacon via “tropo” at G0AEV. F5KCK and EI0TEN are sometimes only heard by scatter, but both these beacons were also reported by short skip Es this month. PI7ETE was also by short Es.

Auroral E contributed to the late evening (21z period) results for Swedish beacons. Many of the German beacons (and GB3RAL too) were heard at G0AEV via auroral backscatter in the early afternoon of the 8th and again in the mid afternoon on 30th. These reports have little influence on the values in the Es-dominated graphs. F2 skip distances are long enough to exclude 28 MHz propagation within Europe by this mode, although 5B and CT3 are still within range.

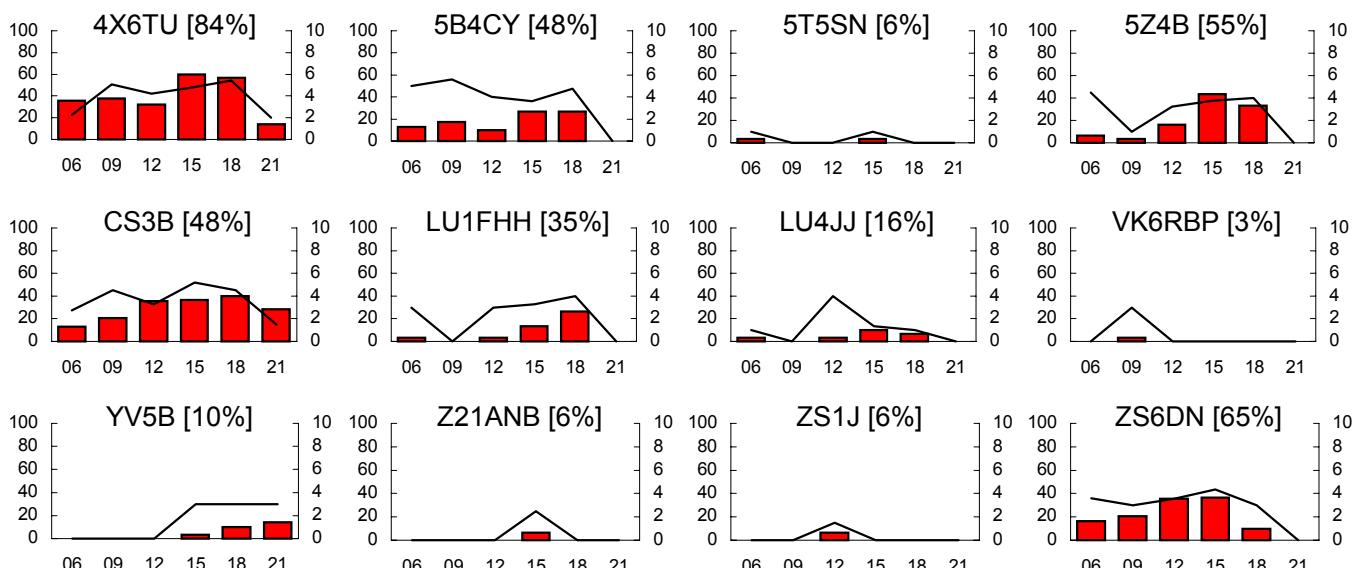

European Beacon Notes.

All of the active DL beacons were heard barring DA5MMB, and all the Italians except I1M, IS0GSR, and IOX (another QRSS QRP beacon apparently transmitting near 28.322 MHz along with IK1ZYW and IS0GSR). Italy is now well supplied with 10m beacons – the list includes a new beacon IQ1SP transmitting with 3w on 28.219.5. The IQ1SP signal was first reported in the UK on 23rd May and the beacon has produced excellent results subsequently. I1M may have been QRT in May - it appeared in June with a much better signal than that heard in previous years.

Scandinavia was well represented by beacons in SM and OH – LA is now without beacon coverage. The results for OH5RAC are rather poorer than might be expected (e.g. when compared with OH2B). Elsewhere a new HA beacon (HA5BHA 28.225) has been heard since mid-May, but there have still been no reports by UK observers of YO2X. EA4DAT seems to have gone off air from about 26th May but this beacon was back on again in mid-June. EI0TEN was also last heard in May (22nd), but unfortunately this beacon has not (yet) come back. Finally, C30P (28.256) became active in the second week of June.

Propagation to Asia, Africa, Oceania, South and Central America

Beacon Graphs.

Suggested propagation modes.

F2 propagation was significantly reduced in May compared with March and April – a function of the approach to mid summer – but this mode still accounted for propagation to central and southern Africa and to South America. F2 was best to ZS6DN, but at a daily reliability of 65% this is a relatively poor performance. Propagation to ZS and on similar paths probably included some TEP or linking of Es to TEP or F2. It is difficult to identify specific cases of Es linking but this style of propagation was responsible for a little propagation to Africa on 6m and equivalent propagation on 10m is likely.. Reliabilities to LU (LU1FFH 35%) were also low, but there was some propagation to all parts of the South American continent. And VK6RBP was still being heard in May – albeit only on one day!

At this time of year there is a problem with interpretation of the results from 4X4TU, 5B4CY and CS3B as these areas are now available by both double hop Es and single hop F2. Data from 10m in previous years and from 6m in May 2005 suggests that double hop Es is a significant factor from mid-May onwards. 6&10 area counts of Es and F assume that F2 was the propagation mode before 15 May and Es for days after this – a simplification.

Beacon Notes.

G3IMW had new beacon 5T5SN (28.190) on 14 and 16 May. There have been no reports since, so it appears activity was of a test or experimental nature. OA4B has been reported again, but on 20m in USA and with broken signals. No signs of a 10m signal. LU4AA is still QRT. The status of other beacons is unclear because of a lack of propagation

10m DX in May 2005

The following list of DX countries worked or heard in the UK comes from packet cluster Spots (DX Summit: <http://oh2aq.kolumbus.com/dxs/>) and from the logs of Six and Ten reporters. The improvement in the number of DX countries from May is mainly due to the presence of Es propagation to the Middle East, Northern Africa and the Caribbean.

DX in May: 4L, 4X, 5B, 5T, 5U, 6W, 7X, 8P, 9G, 9Y, CE, CN, CT3, CX, D4, E2, EA8, EA9, HP, HZ, J7, KP2, LU, P4, PY, PZ, TA, TI, TZ, UN, V2, VU, XT, YV, ZC, ZS.

DX in April for comparison: 4X, 5Z, 6W, 7X, 9G, A2, CE, CX, D2, EA8, LU, PY, SU, TT, TZ, YI, Z2, ZD7, ZS.

Propagation to North America

No continental North American 10m beacons were reported in May, and packet cluster spots suggest that no contacts were made either. There was a little propagation to the Caribbean (8P, 9Y, HP, J7, KP2, V2) and this may have been multi-hop Es. On six metres multi-hop Es produced a one or two weak openings to W and VE as well as to some of the Caribbean countries. This suggests that similar openings were also present at 28 MHz - presumably the openings to W and VE were missed through an absence of the dedicated band usage provided by the 6m community.

Analysis of 50 MHz reports from the UK

UK 50 MHz reports for May 2005 from G2ADR, G2AHU, G3HBR, G3IMW, G3USF, G4UPS, GM4WJA, and via packet cluster spots. Compilation and commentary by G0AEV.

The first half of the month was generally rather poor, enlivened only by a moderate Es opening on 1st and a strong aurora on 8th. In the absence of other propagation, MS via JT6M was used quite frequently to make inter-European contacts.

The second half of the month was quite different. From 15th onwards most days saw moderate to very good propagation with at least some Sporadic E on each day. Very good days for sporadic E were 19, 29 and 30th – 30 or more countries were heard/worked by UK stations on each of these days. DX worked in the second half of the month included 2 and 3 hop Es (e.g. to W/VE on 3 days) and F2/TEP with Es (e.g. to 9Q on 2 days). The period was bracketed by another two good auroras (15th and 30th), and there was reasonably good tropo too. MS activity was significantly lower than in the first two weeks.

Comments on May's propagation from 6&10 contributors:

- “Hopes justified at last” (Eric G2ADR)
- “A wee bit better than last month that's for sure” (Ted G4UPS – whose log shows more than just a “wee” improvement!)
- “The sporadic season seems to have been very slow in starting and then to have been very spotty but there has been some good propagation. There were two days (23 and 31) when the band was open for long periods to Cyprus and very little else. On 30 there was propagation to A4 and A6 and on 31 very strong to A6.” (Brian G3HBR)
- “There was a certain amount of Es as well as two good auroras which reached down to SW England”(Jeremy G3IMW)

Sporadic E

Sporadic E results tabulated below ordered alphabetically by country prefix. Percentages following the country name are the daily reliability values (the number of days when propagation was reported). The first row of each table, “D” is the day of the month, subsequent rows give the maximum signal strength reported from the UK in each of three hour time bands (“06” for the band 0600 - 0900, “09” for the band 0900 - 1200, etc.). A figure of “0” indicates that signal strength was not reported.

Sporadic E backscatter

1st 1146 G4FUF > HB9SIX “Es backscatter”
15 1252 GM7PBB (IO68) > GJ8BCG 58 “scatter”
30 0632 G3WZT > GM4NFC “Strong back scatter”
30 1004 G4OBK (IO94) > MM0CWJ (IO67), GD0TEP 589 (both backscatter)

Es and Aurora on 30th May.

The events of the 30th are quite interesting. Strong sporadic E was present throughout the morning. The period saws good propagation to the north including short skip between southern G and GM, and between G and OY. During this period there was some weak aurora (G to OH and GB3LER. Shortly after 1300 (times different for different locations) the E propagation disappeared to be replaced half and hour or so later with a major aurora that lasted all afternoon. G3IMW and G4UPS (both in IO80) commented on a very sudden change in propagation at this time. Auroral E to JX, TF and VE8 followed (and lightly overlapped) the aurora in the late evening.

The morning propagation must have been Es from the widespread geographical distribution of paths within Europe, and from the inclusion in the event of multihop propagation to the Middle East, VE and the Caribbean. But there may also have been auroral E in the lead up to the aurora (eg, to TF) – although how this could be differentiated from Es in this case I don't know. And, as has been suggested before in similar situations, perhaps the Es was in some way connected to the aurora.

Es Propagation Summary.

The table below displays total counts of country/areas heard/worked via sporadic E by UK amateurs, a summary of the detailed tables presented above. 3-hourly periods in which 20 or more countries were heard or worked are shaded grey, and for 10-19 countries are shaded yellow (or a pale grey if you read is in monochrome!!)

Es Summary

	1	2	3	4	5	6	7	8	9	10	11	12	13	14	15	16	17	18	19	20	21	22	23	24	25	26	27	28	29	30	31

21																	1	3	5	2			1	2	1	2	5		2		

The strong Es seen in the last week of April continued only up until 1st May after which activity dropped to the poor and patchy levels more typical of early April than early May. On 16th the period of poor conditions ended abruptly and the second half of the month was characterised by frequent, sometimes strong and extensive, sporadic E on nearly all days – the typical mid-summer pattern. In detail there were two spells of high activity: 16th- 22nd (with 19th the best day) and 27th-31st (best day 30th).

Overall, despite the poor start to the month, May looks quite good in comparison with the results from previous years. This is illustrated in the graph on the following page, which displays 27-day moving averages of the daily 6m country/area scores (as calculated in the 6&10 Reports), against a 10-year average of the same measure. See the May 2004 Six and Ten Report for a detailed discussion of the use of 27 day moving averages in this graph.

The relatively strong showings of sporadic E at the end of April and again at the end of May dominate the data and the poor early May conditions appear to have little influence. The overall trend of the 2005 line is clearly upward, and at a significantly steep gradient than the 11-year mean. Unfortunately, sporadic E in June does not seem to have been up to this standard. Poor conditions that appear to have existed in early June will modify the 27-day averages for late May and these new data will tend to reduce the difference between the 2005 and 11-year mean lines

50 MHz Es (27day moving averages)
2005-2006 season compared to 11 year average

DX Propagation

There were few restricted DX openings, mainly to 9Q0AR, as shown in the tabulation and listings below. 9Q and PY were presumably via Es linking into trans-equatorial F-layer propagation (which was probably true TEP). The openings to D4B are included in this section although, on reflection, these openings are quite likely to be multi-hop Es without other modes involved

Meteor Scatter

The total reported/spotted numbers of meteor scatter QSOs (and of all JT6M QSOs) were slightly lower overall than in the previous month. In particular there was a very significant decline in JT6M activity from 16th May onwards when high sporadic E activity levels appeared to kill off interest in MS.

Most JT6M QSOs are completed via meteor scatter, although this is not always obvious from the available data. In the following analysis JT6M contacts identified as made by Tropo and Esare excluded – these are reported in their respective sections.

Table of MS QSOs (mostly via JT6M) in May by day. Weekend days are highlighted

Date	1	2	3	4	5	6	7	8	9	10	11	12	13	14	15	16	17	18	19	20	21	22	23	24	25	26	27	28	29	30	31

Tropospheric propagation

Plenty of short and medium haul tropo contacts were spotted this month, many made in contests or from working GJ8BCG/P (who had a very active fortnight). Interesting tropo data includes evidence that “tropo” conditions were significantly above the norm, or contacts made over distances of around 500 km and greater - and clearly most of the inter-UK contacts and those between stations in SE England and PA, ON, etc are not of this order. Actual distances covered can not be determined in the absence of the grid locators for both stations (although some time-consuming locator research would probably find these). The following selected QSOs (all believed to be tropo or probable tropo, although there may be some unintended inclusion of MS or Es backscatter) represent May’s “long(er)-haul” data.

14 th	1102	PA2M > GJ8BCG/P “up to 55 here - 3el@10m”
	1241	DL1EJA > GJ8BCG/P 559

Aurora

Several geomagnetic storms produced good auroral conditions on 8th and 30th. There was a moderately good event on 15th and a number of lesser events. On both 8th and 30th openings were extensive providing aurora contacts for stations in all parts of Britain, including to near-European and Scandinavian countries. The most southerly contacts were with S5, made in the late phase of the aurora of the 8th. Auroral E was associated with most of these aurora, and on two occasions auroral E openings extended between GM and VE8.

John GM4WJA writes “I know it's news for next month but (I) worked VE5UF in DO61 on 6m at 2249 on 12th June and exchanged 44a and 55a reports”. Something to look forward to!

1 st	15z	1737	MM0AMW (IO75) > GB3LER 53A
	18z		Aurora in early evening at GM4WJA
7 th	18z-21z		Aurora in mid to late evening (GM4WJA). Auroral E in 21z period.
Major event			
8 th	00z	0127	MM0AMW > TF3SIX 52A. Auroral E (including to VE8) – see below.
	12z	1224	LB6YD (JO59) > GB3LER 52A
	1237-1251		MM0AMW > GB3LER 53A; GW8IZR (IO73) > GB3LER 55A QTF 010
	1300-1400		Many reports G<>GM; LA2IM (JP43), SM0TSC > GB6LER (both 55A); MM0AMW > OY6SMC 53A

Solar and Geomagnetic Data for May 2005

Data supplied by G0CAS (Sun Mag¹) and from Internet sources. Compilation by G0AEV.

Sunspot numbers (SEC)	Mean 65.4	Max 117 (11 th)	Min 22 (20 th)
Solar Flux (28 MHz)	Mean 99.5	Max 126 (13 th)	Min 82 (21 st -22 nd)

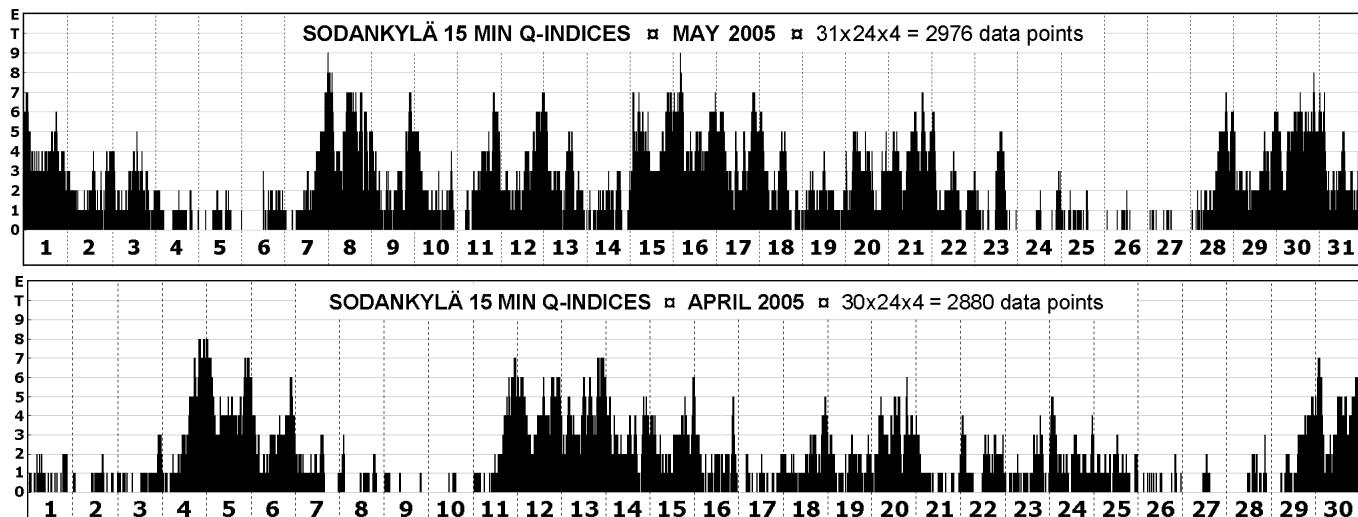

Solar data for May 2005 are presented in the table at the end of this section. Numbers in the 28 and 50 MHz columns of this table are the total daily "areas" worked/heard from the UK for each of several propagation modes and are a summary of the data presented in the first sections of this Report. On 28 MHz "areas" refer to the number of beacons reported via Es and F-layer; on 50 MHz the number of countries via Es, F-layer, Aurora and Auroral E. F2 critical frequencies are from Chilton in Oxfordshire. SIDC spots are from SIDC, and other solar data from the joint USAF/NOAA daily summaries or directly from SEC.

Energetic Events.

The sun was more active in May than May. There were 13 M class X-ray solar events on 9 days in May but no M or X class X-ray solar events in May (and none of C class either).

Q-indices from Sodankylä, Finland (Thanks to OH2LX)

Q-indices for May (top) with data from the previous month (below)

Geomagnetic data from the Finnish observatories for May are:

Monthly averages

Sodankylä: monthly Ak average = 26.8 (17.9 in Apr)
Nurmijärvi: monthly Ak average = 20.4 (10.0 in Apr)

Most disturbed May days:

Sodankylä: 8th, Ak = 136 (Apr 5th Ak = 60)
Nurmijärvi: 8th, Ak = 119 (Apr 12th Ak = 29)

¹ Sun Mag: Sunspot and Magnetic data compiled by Neil Clarke G0CAS. Email neil@g0cas.demon.co.uk

K-indices.

The following four tables present the Kp index (from SEC) and the Lerwick ("KL"), Eskdalemuir ("KE"), and Hartland ("KH") K-indices (from the British Geological Survey). Each table is set out with the day of the month in the top row followed by rows containing the K-values or each 3-hour period. The bottom row of each table is the sum of the K-values for the day. Pale (yellow) shading indicates K = 5, darker (grey) when K > 5. There were 10 May days when Kp or the UK K-indices reached 5 or higher.

50 MHz Outside Britain

Compilation and Commentary by G3USF

Europe, Africa and the Middle East

Auroral-Related Propagation

Only five auroral days in continental Europe this month - fewer than in North America - but two of them were real crackers. The event on the 8th (Ap 64 with Ak 136 at Sodankyla) ebbed a flowed through most of the day and reached south of the Baltic for a good eight hours. At its peak contacts were worked from Croatia, Slovenia and northern Italy, including a rare one between southern Sweden and Moldova. In addition, the VE8 beacon was received in Scotland and Denmark in the early hours, probably by auroral E - at this time of year it can be more difficult to feel confident about high-latitude T9 reports since multihop Es may also be a possibility. However, in this case, a geomagnetic disturbance was under way, with a K6 at high latitudes for the period 0000-0300UTC, so the probability of AE was quite high. In a few other cases in the listing below identification of the propagation mode is less certain. VE8 reports from GM are not infrequent but reported reception in OZ was unusual.

The other substantial event, on the 30th, spread over about ten hours and covered a wide geographical area, although it did not reach quite as far south. The VE8 beacon, was again heard although as usual no contacts ensued. Again the probable propagation mechanism was auroral E. The report of VE8BY into GM on the 29th is less clear-cut as geomagnetic levels were relatively low.

As always we are indebted to OH5IY and OH2LX for data from Finland.

Other Modes

There is something of a tendency to dismiss 50MHz as lacking interest during the lower half of the cycle. That may be true of the autumn months but this month provided many reminders of how interesting the band can be in the summer, thanks essentially to sporadic-E, either in its own right or in conjunction with other modes. Although the 1st provided early strong openings, including 9Q5AR into the Mediterranean, which SV1DH ascribes to a combination of Es and TEP, the season did not get into full swing until the middle of the month. As in the UK, much of the activity up to that point was reported by operators using JT6M for (mostly) MS working.

From the 15th onwards Es was present for substantial periods every day, producing a more substantial early season than in many years. The 15th was an interesting start point because it was also one of the most disturbed days, yet it brought multihop openings to the Gulf states, including some contacts which probably required 3xEs. Indeed, the remainder of the month was notable for the number of multihop contacts - though this may in part be a consequence of increased activity around the Gulf and in Central Asia - with EX, EY, UK, UN and 4L active - than an underlying enhancement of Es. It is worth noting that a number of multihop contacts were reported on the 30th despite/because of(?) an Ap of 67.

The most notable multihop reports featured openings to 5B, IT9 and 9H (plus A4) between 0715 and 1043 on the 29th. The most distant of these would appear to have called for at least 5xEs hops, and the shortest needed 4xEs. Less unusual, though still worthy of comment, were the many contacts between Europe and the Arabian Gulf. For parts of Europe A4, A6 and A7 would have been within single hop range, but western European stations would have needed two or even three hops. This month's crop was particularly rich. In 2004 openings were reported on only three days, compared with no fewer than fifteen days this year. There is no telling how far this can be attributed to improved propagation and how far to activity, which seems to have increased considerably over the year - perhaps in some measure because of better propagation!

4L	1 day	17(G)

The same cannot be said of propagation between Europe and Africa. There were no reports of contacts with southern Africa; in 2004 openings were reported on eight days. However, somewhat further north, 9Q0AR was worked on four days, on two of which signals extended to northern Europe, probably by a combination of TEP and Es. And while West Africa produced no reports of TR stations, not even the TR0A beacon. However, this was more than compensated by greater activity from 5T5SN/5T5DUB, who was heard across most of Europe - though apparently not Scandinavia. While many of these openings occurred during the evening signals were reported as early as before 1000 on the 21st and at 1254 on the 20th.

Europe<>Africa

TZ	1day	22(PA)

Westward, this was a productive month. Apart from the VE8BY loggings on the 1st, 16th and 30th, probably attributable to AE, North America was reported in northern Europe on four days (22, 26, 29, 30), compared with three in 2004, into Iberia on seven days (4) and along the Mediterranean on two days (nil). More strikingly, no openings to the Caribbean were recorded in 2004 but this year brought openings on seven days, covering nine different 'entities' and extending into northern Europe on five of them. All the western hemisphere openings called for at least 3xEs.

Finally among DX events, the modest group of openings between Europe and South America again exceeded 2004's modest single PY<>IS0 report and was notable for reaching over to LZ, YO and SV to the east and reaching DL and G further north. Costas, SV1DH, suggests TEP plus multihop Es as the propagation mode.

Other Modes

In North America the sporadic-E season appears to have got under way about a week earlier than in Europe. This was particularly marked in respect of working contacts with the Caribbean - though one suspects that there was also an underlying increase in both activity and reporting. 1Es would account for a substantial proportion of the contacts but, as in Europe, 2xEs seems to have been fairly common, including several openings between KL7 and the southern 48 states, but inadequate information about the location of many stations makes it impossible to assess the full extent.

Contacts between the United States and South America were more numerous than in 2004. Those with the northern fringe of the continent are perhaps better understood in the context of Caribbean openings - that is, they are likely to have been due to multihop sporadic-E. However, the openings to Brazil, Argentina, Uruguay and Paraguay probably arose from a combination of Es and tEP. Openings south of the Equator were reported on the 16th, 17th, 18th, 19th and 20th, compared with a single day in 2004, and while as usual there were no openings from Canada, the geographical spread of the openings appears to have been rather wider than in 2004. This also applies to contacts with YV, HP, FY and PZ, which were not reported at all in May 2004.

Paths between North America and Africa were rather more frequent than in 2004, but this may well have been thanks to 5T5SN and D4B activity rather than improved propagation. Contacts were also reported between the African mainland and the Caribbean.

Asia and Oceania

Japan

Japan<>Australia

VK2	1 day	14	VK6	12 days	3-6 8 -11 13-15 17
VK4	9 days	4-7 10 12 14 15 17	VK8	0 days	4 7-9
VK5	1 day 1	4			

Propagation between Australia and Japan was slightly down on 2004, with reports on thirteen days rather than 15. In neither year was ZL reported. In both years there was an abrupt cut-off, with no reports after the 17th this year and only one after the 20th in 2004.

The major departure from an essentially Pacific-centered range of reports was the opening to IT9, 9H, 5B and A45 on the 29th, which seems to have been among the better days almost everywhere - for no very obvious reason.

6m DX results in JA during May from JA1VOK

Beacon News and 28 MHz Worldwide

Compilation and Commentary by G3USF

Beacon News

28001	IS0ATZ reported here with 5 watts in JN49HV (DJ7KG July)
28167.4	LU8DBJ reported by DJ7KG (July)
28191	LU7VCH in Rio Negro, Patagonia with 5 watts reported (G4TMV July)
28227.5	IZ3FZQ new beacon Near Rovigo (JN55VB) runs 5 watts to inverted Vee (IZ3FZQ July)
28239	IZ2DAY in JN45PM reported active again with 10 watts and GP (G0AEV, July)
50006	A7A now understood to be operational (August)
50056	HA5XXA in JN97MN new beacon running 5 watts to GP (HA5OV, Aug.)
50080	K0BUY - new beacon reported here from EM07(NSD7K July)
50080.9	AC7XP new beacon no further details (K0HA)
50087	RB3SIX reported in KO73EF (LA6PV Aug)

28 MHz Worldwide

In the Northern Hemisphere sporadic-E was the dominant mode, although in Europe, as at 50MHz it only became a consistent through-the-day feature in the second half of the month, being reported solidly in all time periods. It was even present on days as disturbed as the 8th, 15th and 30th. (DJ7KG reported DL0IGI auroral at 1404 on the 8th, while auroral contacts were reported fairly widely on the afternoon and early evening of the 30th, and SM2ZIY heard DL0IGI 539 during the later stages of the storm, presumably by AE at 0002 on the 29th. There were no auroral reports during the storm on the 15th - but SM2LIY reported OH9TEN auroral at 1546 on the 10th, which scarcely rated as an auroral day.) AA1TT in New Hampshire reported the VE4TEN and KA0PSE beacons auroral at 0420 on the 17th - another day that was not notably auroral.

Paths between Europe and Africa held up well, with openings reported at some time on all days, although reliability during the daily time periods was down on 2004. However, decline was more marked with Europe<>South America, which opened on all days in 2004 but on only 20 days in 2005; the evening path was down from 84 per cent reliability to 65 per cent. However, there was a particularly good opening during the WPX contest up to 2233 on the 29th. Asia (mainly western Asia, although there were some openings as far east as Japan) provided contacts from Europe (but mostly southern and eastern areas) on 27 days - a surprising improvement on 2004. Openings between Europe and Oceania were almost all from the Mediterranean. So, too, were contacts with North America (mainly featuring Caribbean stations at the western end). In all, there were reports on twelve days. Several of these occurred during the WPX contest, when DF0CG worked N4BAA and K3DV between 1952 and 2002 on the 28th with an Africa beam heading, while CT1AOZ worked KE5CTY at 2050 and G4OBK contacted 9Y4W at 2052. Beam heading is not mentioned in those reports and they could have been due to multihop Es, of which little was explicitly reported.

Contacts within North/Central America were reported on all days, mainly by Es. South American paths were open at some time every day except the stormy 15th; the reliability at the main time periods was little different from 2004. North America to Asia was in practical terms unworkable, while there were only occasional reports between South America and Asia - though reports of the low-power LU1FHH beacon, long path, from the vigilant JG2TKH at 1322 on the 11th and 1217 on the 12th suggested that opportunities may have been missed.

Among other reports worth noting were 5Z4DZ working ZK1JD at 2345 on the 7th and VK9NS at 2350 on the 7th, long path; VK2UBF with W0PV/4 at 0542 on the 8th and ZL6QH working CT7B over the US at 2218 on the 28th. However irritating contests are to many operators, they at least stimulate contacts that many might have thought improbable during the lower years of the cycle - and with the solar flux below 100 for much of the month there could be little doubt that this was where we now were.
